

An interconnecting device which interconnects communication in a computer network. The interconnecting device includes a first holding unit which holds a removable nonvolatile memory, a reading unit which reads a first device identifier of a first communication device, which is allowed to communicate in the computer network, from the nonvolatile memory held by the first holding unit, and a setting unit which sets a communication setting of the computer network so as to allow the first communication device identified by the first device identifier to communicate in the computer network.
